| Project Name | Smart waste management system for metropolitan cities |

1. INTRODUCTION

1.1 Project Overview:

With the increasing population and industrialization of nations throughout the globe, waste has become a great concern for all of us. Over years, researchers figured that only waste management is not enough for its proper treatment and disposal techniques to preserve our environment and keeping it clean in this era of globalization. With the help of technology researchers have, introduced IoT based Smart Waste Management solutions and initiatives that ensures reduced amount of time and energy required to provide waste management services and reduce the amount of waste generated. Unfortunately, developing countries are not being able to implement those existing solutions due to many factors like socio-economic environment. Therefore, in this research we have concentrated our thought on developing a smart IoT based waste management system for developing countries like INDIA that recycling of household waste with the minimum amount of resources being available

1.2 Purpose:

We amalgamate technology along with waste management in order to effectively create a safe and a hygienic environment. Smart waste management is about using technology and data to create a more efficient waste industry. Based on IoT (Internet of Things) technology, smart waste management aims to optimize resource allocation, reduce running costs, and increase the sustainability of waste services. This makes it possible to plan more efficient routes for the trash collectors who empty the bins, but also lowers the chance of any bin being full for over a week. A good level of coordination exists between the garbage collectors and the information supplied via technology. This makes them well aware of the existing garbage level and instigate them whenever the bins reach the threshold level. They are sent with alert messages so that they can collect the garbage on time without littering the surrounding area. The fill patterns of specific containers can be identified by historical data and managed accordingly in the long term. In addition to hardware solutions, mobile applications are used to overcome the challenges in the regular waste management system, such as keeping track of the drivers while they are operating on the field. Thus, smart waste management provides us with the most optimal way of managing the waste in an efficient manner using technology.

2. LITERATURE SURVEY:

2.1 Existing problem:

Waste management has become an alarming challenge in local towns and cities across the world. Often the local area bins are overflowing and the municipalities are not aware of it. This affects the residents of that particular area in numerous ways starting from bad odour to unhygienic and unsafe surroundings. Poor waste management - ranging from non-existing collection systems to ineffective disposal - causes air pollution, water and soil contamination. Open and unsanitary areas contribute to contamination of drinking water and can cause infection and transmit diseases. Toxic components such as Persistent Organic Pollutants (POPs) pose particularly significant risks to human health and the environment as they accumulate through the food chain. Animals eating contaminated plants have higher doses of contaminants than if they were directly exposed. Precipitation or surface water seeping through waste will absorb hazardous components from landfills, agricultural areas, feedlots, etc. and carry them into surface and groundwater. Contaminated groundwater also poses a great health risk, as it is often used for drinking, bathing and recreation, as well as in agricultural and industrial activities. Landfills and waste transfer stations can attract various pests (insects, rodents, gulls, etc.) that look for food from waste. These pests can spread diseases through viruses and bacteria (i.e., salmonella and e-coli), which are a risk to human health.

2.2

Paper 1

TITLE: Smart City Waste Management through ICT and IOT driven

AUTHOR NAME: Dipak.G , P.S.Aithal

PUBLICATION YEAR: 2021

DESCRIPTION: The growing population and mass relocation of citizens from urban and semi-urban areas to Smart Cities have resulted in exponential growth in Smart Cities and thereby certain challenges. One of the major challenges Smart Cities are facing is to control, manage and process waste generation on a daily basis. Waste collection and processing at a wider scale is not an easy job. The growing population and resource constraints in waste management activities are the primary reasons, which have made waste management a tough job. To deal with this challenging process, Smart Cities use Smart Waste Management System. (iSmartWMS)

PAPER 2:**TITLE:** Household Waste Management System Using IoT**AUTHOR NAME:** Pushpa Singh, Krishna Kant Singh**PUBLICATION YEAR:** 2020

DESCRIPTION: This model discusses the collection and decomposition of waste in the smart way so that benefit from the waste is maximized and the actual waste is minimized efficiently. This paper focus on the segregation of the waste at two levels: the first level of segregation is on the individual house of the society and the second level of segregation is at the society. Author, discuss the recycling of the biodegradable waste for making compost. The machine learning technique such as KNN is used to generate an alert message for various combinations of three sensor values like level of bio and non-biodegradable waste, concentration of poisonous gas. The overall impact of this research is in the upliftment of the green technologies by reducing pollutants, conserving, resourcing and reusing the energy through the use of technology.

Paper 3:**TITLE:** Smart Waste Collection System**AUTHOR NAME:** Javed Ramzan; Muhammad Wasif Nisar**PUBLICATION YEAR:** 2018

DESCRIPTION: This project named smart waste collection is need of today as there is no efficient waste collection system installed in the earth these days this system is to revolve the waste collection method of the advancing technological 21st century. This system is supported by an android app named “SWC” and firebase real-time data for more efficient user-friendly usage. where’s cloud storage also makes it easier for storage of collection records providing the authorized origination to control manage and audit performance data. To compare several collectors, their configurations, and program behavior, we use an accurate simulator that models all heap objects and the pointers among them, but does not model cache or other memory effects. For object-oriented languages, our results demonstrate that an older-first collector, which collects older objects before the youngest ones, copies on average much less data than generational collectors. More importantly, we reopen for consideration the question where in the heap and with which policies copying collectors will achieve their best performance.

Paper 4:**TITLE:** Smart Garbage Management System**AUTHOR NAME:** Akshat Mishra, Sushmit Mehta, Vivek Solvande**PUBLICATION YEAR:** 2018

DESCRIPTION: The proposed system monitors the garbage bin. While monitoring the garbage bin it sends the notification to the authority about the level of garbage filled. If the lower authority ignores the notification, the next notification goes to the higher authority. The proposed system will help them to actually know that where and when to go to collect the garbage. The proposed system manages the effort to check the area by visiting there. The proposed project is quite helpful for both the Brihan Mumbai Municipal Corporation (BMC) and the citizens in that area by time-to time interaction between Brihan Mumbai Municipal Corporation (BMC) and the proposed system. Hence the proposed system makes a better way to manage garbage.

PAPER 5:**TITLE:** Waste Management Initiatives in India For Human Wellbeing**AUTHOR NAME:** Dr. Raveesh Agarwal, Mona Chaudhary and Jayveer Singh**PUBLICATION YEAR:** 2015**DESCRIPTION:**

The objective of this paper is to examine the present methods used in India for the welfare of its people in different waste management efforts. The other goal is to offer advice on how to make Indian municipalities' trash disposal procedures better. On secondary research, this essay is founded. The system is improved by looking at the reports that have already been written about waste management and the suggestions made for improvement by planners, NGOs, consultants, government accountability organisations, and important business leaders. It provides in-depth understanding of the various waste management programmes in India and identifies areas where waste management might be improved for societal benefit. The essay makes an effort to comprehend the crucial part that our nation's official waste management sector plays in the waste management process.

2.3 Problem Statement Definition:

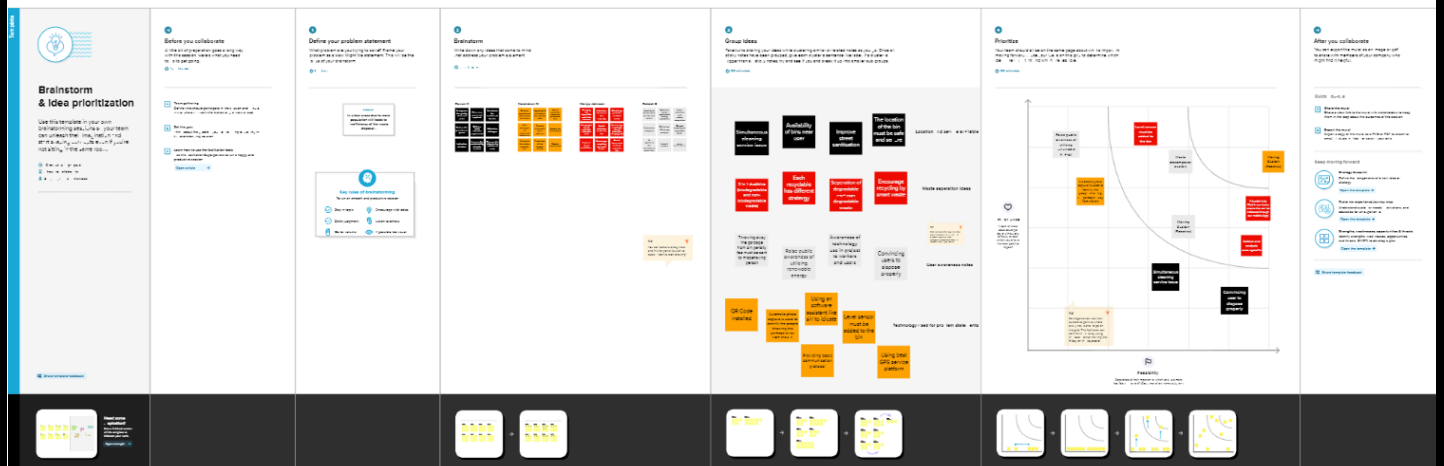

| Problem Statement (PS) | I am (Customer) | I'm trying to | But | Because | Which makes me feel |
|------------------------|----------------------------------|---|---|---|---|
| PS-1 | A small waste garbage collector. | Use the technology and data to create a more efficient garbage waste. Based on IOT & Cloud. | Some drivers collect empty bins, predefined collection routes of the system cause waste of time, an increase in fuel consumption, and excessive use of resources. | The smart waste garbage collector is a specially designed method to dispose the garbage in a smart way. | When it solves the social issues of hygiene in the country. |

3. IDEATION & PROPOSED SOLUTION

3.1 Empathy Map Canvas

3.2 Ideation & Brainstorming

3.3 Proposed Solution

| S.No. | Parameter | Description |
|-------|--|---|
| 1. | Problem Statement (Problem to be solved) | To maintain waste in the metropolitan cities and to maintain the clean environment which is polluted by the wastes and to dispose wastes. |
| 2. | Idea / Solution description | -Software can be implemented -Fine can be implemented -Create awareness |
| 3. | Novelty / Uniqueness | This system provides awareness among the people and safeguard the environment with the help of people. |
| 4. | Social Impact / Customer Satisfaction | Clean cities Healthy environment Peaceful life |
| 5. | Business Model (Revenue Model) | -Offering software as a servicemodel to government. -Making use of useful wastes and making it us money. |
| 6. | Scalability of the Solution | To help government to maintain clean environment. |

3.4 Problem Solution fit

Problem-Solution fit canvas 2.0

Purpose / Vision

| | | | | |
|-------------------------|---|---|--|---------------------------------------|
| Define CS, fit into CC | 1. CUSTOMER SEGMENT(S) CS Who is your customer? i.e. working parents of 0-5 y.o. kids <div>PEOPLE</div> | 6. CUSTOMER CONSTRAINTS CC What constraints prevent your customers from taking action or limit their choices of solutions? i.e. spending power, budget, no cash, network connection, available devices <div>To avoid the non-degradable wastes</div> | 5. AVAILABLE SOLUTIONS AS Which solutions are available to the customers when they face the problem or need to get the job done? Who has it, tried in the past? Who provides it, how do these solutions work? i.e. pen and paper is an alternative to digital, not taking <div>1. Can create a software for monitoring wastages 2. Recycle the useful wastes</div> | Explore AS, differentiate |
| | 2. JOBS-TO-BE-DONE / PROBLEMS J&P Which jobs-to-be-done (or problems) do you address for your customers? There could be more than one, explore different sides <div>1. To avoid the use of Harmful wastes. 2. To protect the Environment.</div> | 9. PROBLEM ROOT CAUSE RC Why is the real reason that this problem exists? What is the back story behind the need to do this job? i.e. customers have to do it because of the chosen innovations <div>1. Due to lack of awareness. 2. Not taking responsibility in environmental issues by people.</div> | 7. BEHAVIOUR BE What does your customer do to address the problem and get the job done? i.e. directly related: find the right solar panel installer, calculate usage and benefits; indirectly associated: customers spend free time on volunteering work (i.e. Greenpeace) <div>Monitor the smart dustbin by using the software</div> | |
| Identify strong TR & EM | 3. TRIGGERS TR What triggers customers to act? i.e. seeing their neighbour installing solar panels, reading about a more efficient solution in the news <div>To create an awareness among the people</div> | 10. YOUR SOLUTION SL If you are working on an existing business, write down your current solution first. Fill in the canvas and check how much it fits to reality. If you are working on a new business proposition, then keep it blank until you fill in the canvas and come up with a solution that fits within customer limitations, solves a problem and matches customer behaviour <div>1. Monitoring the wastage frequently 2. Harmful wastages must be banned</div> | 8. CHANNELS of BEHAVIOUR CH ONLINE What kind of actions do customers take online? (Extract online channels from #7) <div>Uneducated people can not use this software</div> | Extract online & offline C, fit of BE |
| | 4. EMOTIONS: BEFORE / AFTER EM How do customers feel: when they face a problem or a job and afterwards? i.e. lost, insecure / confident, in control - use it in your communication strategy & design <div>Safeguard the future generation</div> | 3.2 OFFLINE What kind of actions do customers take offline? (Extract offline channels from #7, and use them for customer development) <div>Due to human carelessness, waste disposal can be complicated</div> | | |

4. REQUIREMENT ANALYSIS

4.1 Functional requirement

Following are the functional requirements of the proposed solution.

| FR No. | Functional Requirement (Epic) |
|--------|---|
| FR-1 | Taking sensor reading from the Sensor Circuit. |
| FR-2 | Pushing the data to a MySQL database. |
| FR-3 | Retrieving information from database for Calculation garbage bin which fulfils the condition for garbage collection, example: Collect garbage from bins whose level is over 80% of bin. |
| FR-4 | A client side script to get Garbage collection live Monitoring. |

4.2 Non-Functional requirements

Following are the non-functional requirements of the proposed solution.

| FR No. | Non-Functional Requirement | Description |
|--------|----------------------------|--|
| NFR-1 | Usability | Usability is a unique and significant perspective to examine user needs, which may further enhance the design quality, according to IoT devices. Analyzing how well people interact with a product may help designers better understand customers' prospective demands for waste management, behavior, and experience in the design process when user experience is at the Centre. |
| NFR-2 | Security | Utilize recyclable bottles. Utilize reusable shopping bags. Spend responsibly and recycle |
| NFR-3 | Reliability | Creating improved working conditions for garbage collectors and drivers is another aspect of smart waste management. Waste collectors will use their time more effectively by attending to bins that require service rather than travelling the same collection routes and servicing empty bins. |
| NFR-4 | Performance | The Smart Sensors assess the fill levels in bins (along with other data) numerous times each day using ultrasonic technology. The sensors feed data to Senone's Smart Waste Management Software System, a robust cloud-based platform with data-driven daily operations and a waste management app, using a variety of IoT networks (NB-IoT, GPRS). As a consequence, customers receive data-driven decision-making services, and garbage collection routes, frequency, and truck loads are optimized, resulting in at least a 30% decrease in route length. |
| NFR-5 | Availability | By creating and implementing robust hardware and gorgeous software, we enable cities, companies, and nations to manage garbage more intelligently. |
| NFR-6 | Scalability | Using smart trash bins allows us to scale up and monitor the rubbish more efficiently while also reducing the number of bins needed in towns and cities. |

5. PROJECT DESIGN

5.1 Data Flow Diagrams

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically.

It shows how data enters and leaves the system, what changes the information, and where data is stored.

A smart waste management platform uses analytics to translate the data gathered in your

bins into actionable insights to help you improve your waste services.

You can receive data on metrics such as:

- The first test conducted is the situation where the garbage bin is empty or its garbage level is very low
- Then, the bin is filled with more garbage until its level has surpassed the first threshold **value, which is set to 80% then the first warning SMS is being sent, as depicted**
- The first notification SMS sent by the system, once the waste reaches the level of 85% full
- The second notification SMS sent by the system, indicating that bin is at least 95% full and **the garbage needs to be collected immediately**
- Locations prone to overflow
- The number of bins needed to avoid overflowing waste
- The number of collection services that could be saved
- The amount of fuel that could be saved
- The driving distance that could be saved.

5.2 Data flow diagram:

5.2 Solution & Technical Architecture:

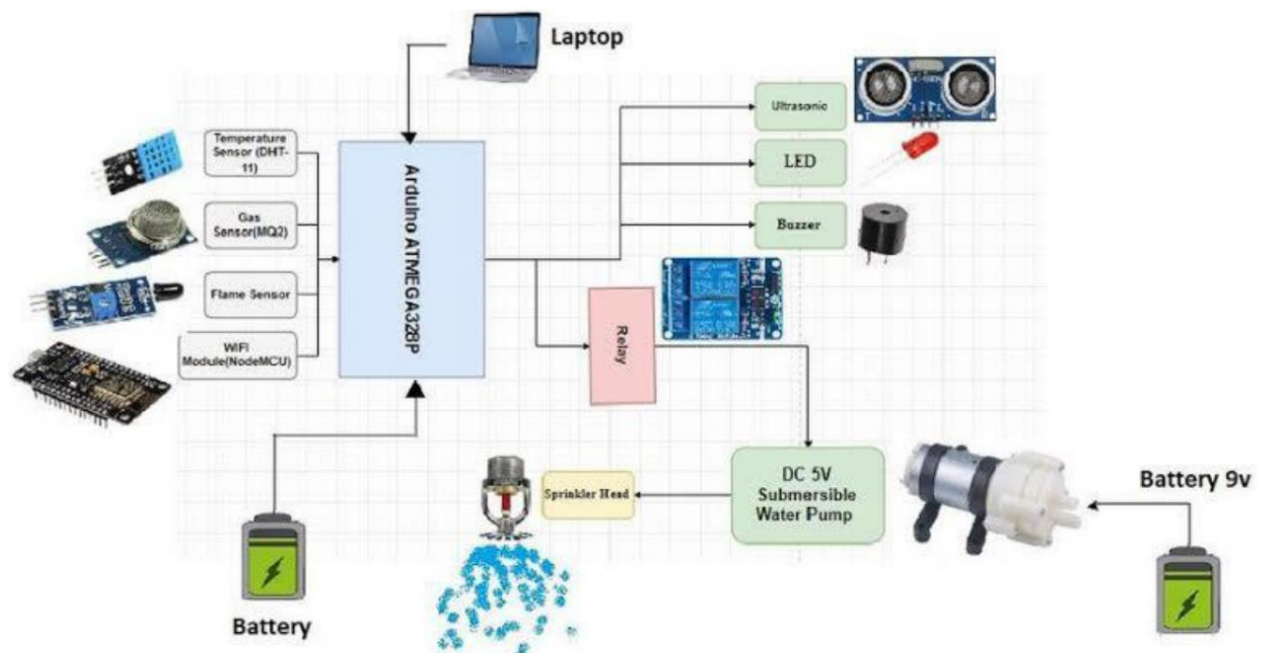

Table-1: Components & Technologies:

| S.no | Component | Description | Technology |
|------|---------------------------------|---|--------------------------------|
| 1. | User Interface | Mobile Application | HTML, CSS, JavaScript. |
| 2. | Application Logic | Logic for a process in the application | Javascript |
| 3. | Database | Data Type, Configurations etc. | Firebase, ibm cloud |
| 4. | Cloud Database | Database Service on Cloud | IBM Cloud |
| 5. | File Storage | File storage requirements | Local Filesystem and IBM cloud |
| 6. | Infrastructure (Server / Cloud) | Application Deployment on CloudLocal Server Configuration | Local and Cloud Foundry |

Table-2:Application Characteristics:

| S.no | Characteristics | Description | Technology |
|------|--------------------------|---|--------------------------|
| 1. | Open-Source Frameworks | GitHub | Internet hosting service |
| 2. | Security Implementations | Application security: Veracode. | Network automation |
| 3. | Scalable Architecture | It provides the room for expansion more databaseof smart bins added additionally can be updated. | Cloud storage |
| 4. | Availability | As the system control is connected to web server itis available 24*7 and can be accessed whenever needed. | Server, Appleixe, reple |
| 5. | Performance | Performance is high it uses 5mb caches | Wireless Sensor Network |

5.3 User Stories

Use the below template to list all the user stories for the product.

| User Type | Functional Requirement (Epic) | User Story Number | User Story / Task | Acceptance criteria | Priority | Release |
|-------------------------|-------------------------------|-------------------|---|---|----------|----------|
| Admin | Login | USN-1 | As an administrator, I assigned user names and passwords to each employee and managed them. | I can control my online account and dashboard. | Medium | Sprint-1 |
| Co-Admin | Login | USN-2 | As a Co-Admin, I'll control the waste level monitor. If a garbage filling alert occurs, I will notify the trash truck of the location and rubbish ID. | I can handle the waste collection. | High | Sprint-1 |
| Truck Driver | Login | USN-3 | As a Truck Driver, I'll follow Co Admin's instruction to reach the filled garbage. | I can take the shortest path to reach the waste filled route specified. | Medium | Sprint-2 |
| Local Garbage Collector | Login | USN-4 | As a Local Garbage Collector, I'll gather all the waste from the garbage, load it onto a garbage truck, and deliver it to Landfills | I can collect the trash, pull it to the truck, and send it out. | Medium | Sprint-3 |
| Municipality officer | Login | USN-5 | As a Municipality officer, I'll make sure everything is proceeding as planned and without any problems. | All of these processes are under my control. | High | Sprint-4 |

6. PROJECT PLANNING & SCHEDULING

6.1 Sprint Planning & Estimation

| TITLE | DESCRIPTION | DATE |
|---|---|-------------------|
| Literature Survey & Information Gathering | Literature survey on the selected project & gathering information by referring the, technical papers, research publications etc. | 28 SEPTEMBER 2022 |
| Prepare Empathy Map | Prepare Empathy Map Canvas to capture the user Pains & Gains, Prepare list of problem statements | 24 SEPTEMBER 2022 |
| Ideation | List the by organizing the brainstorming session and prioritize the top 3 ideas based on the feasibility & importance. | 25 SEPTEMBER 2022 |
| Proposed Solution | Prepare the proposed solution document, which includes the novelty, feasibility of idea, business model, social impact, scalability of solution, etc. | 23 SEPTEMBER 2022 |
| Problem Solution Fit | Prepare problem - solution fit document. | 30 SEPTEMBER 2022 |
| Solution Architecture | Prepare solution architecture document. | 28 SEPTEMBER 2022 |

| | | |
|--|---|-----------------|
| Customer Journey | Prepare the customer journey maps to understand the user interactions & experiences with the application (entry to exit). | 05 OCTOBER 2022 |
| Functional Requirement | Prepare the functional requirement document. | 11 OCTOBER 2022 |
| Data Flow Diagrams | Draw the data flow diagrams and submit for review. | 12 OCTOBER 2022 |
| Technology Architecture | Prepare the technology architecture diagram. | 13 OCTOBER 2022 |
| Prepare Milestone & Activity List | Prepare the milestones & activity list of the project. | 21 OCTOBER 2022 |
| Project Development - Delivery of Sprint-1, 2, 3 & 4 | Develop & submit the developed code by testing it. | IN PROGRESS |

| Sprint | Functional Requirement (Epic) | User Story Number | User Story/Task | Story Points | Priority | Team Members |
|-----------|-------------------------------|-------------------|--|--------------|----------|--|
| Sprint-1 | Cloud | USN-1 | Cloud web server is created which connects the bin and the authority who is responsible for the disposal of waste from its bin | 10 | High | Pawan k Narendran M Mariya Johnson Rakesh S |
| Sprint-1 | Software | USN-2 | Design the circuit which is to be integrated within the garbage bin using sensors. | 10 | High | Pawan k Narendran M Mariya Johnson Rakesh S |
| Sprint-2 | Cloud Server | USN-3 | Upload the details of truck driver and location of bin using GPS | 5 | Medium | Pawan k Narendran M Mariya Johnson Rakesh S |
| Sprint-2 | Technology | USN-4 | Connect cloud server and bins | 5 | High | Pawan k Narendran M Mariya Johnson Rakesh S |
| Sprint-2 | Sensor | USN-5 | Detect the level of garbage using sensor and stores it in the server for specific interval of time. | 10 | High | Pawan k Narendran M Mariya Johnson Rakesh S |
| Sprint -3 | Python, GPS | USN-6 | Write the python code for intimating to the authority about alerting message regarding | 10 | High | Pawan k Narendran M Mariya Johnson |

6.2. Sprint Delivery Schedule

| Sprint | Total Story Points | Duration | Sprint Start Date | Sprint End Date (Planned) | Story Points Completed (as on Planned End Date) | Sprint Release Date (Actual) |
|----------|--------------------|----------|-------------------|---------------------------|---|------------------------------|
| Sprint-1 | 20 | 6 Days | 24 Oct 2022 | 29 Oct 2022 | 20 | 31 Oct 2022 |
| Sprint-2 | 20 | 6 Days | 31 Oct 2022 | 5 Nov 2022 | 20 | |
| Sprint-3 | 20 | 6 Days | 7 Nov 2022 | 12 Nov 2022 | 20 | |
| Sprint-4 | 20 | 6 Days | 14 Nov 2022 | 19 Nov 2022 | 20 | |

Velocity:

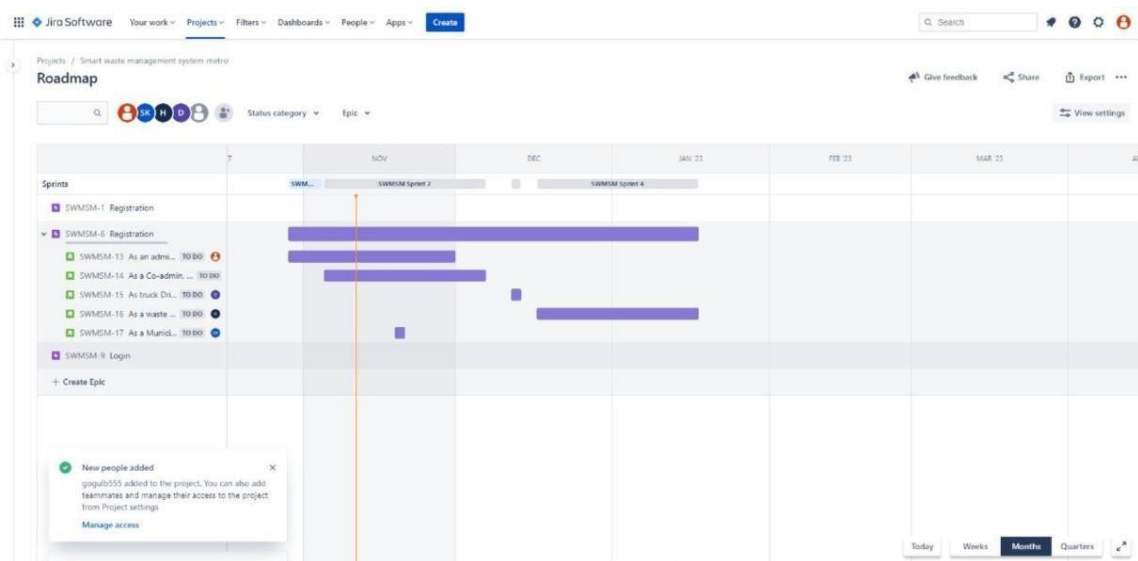

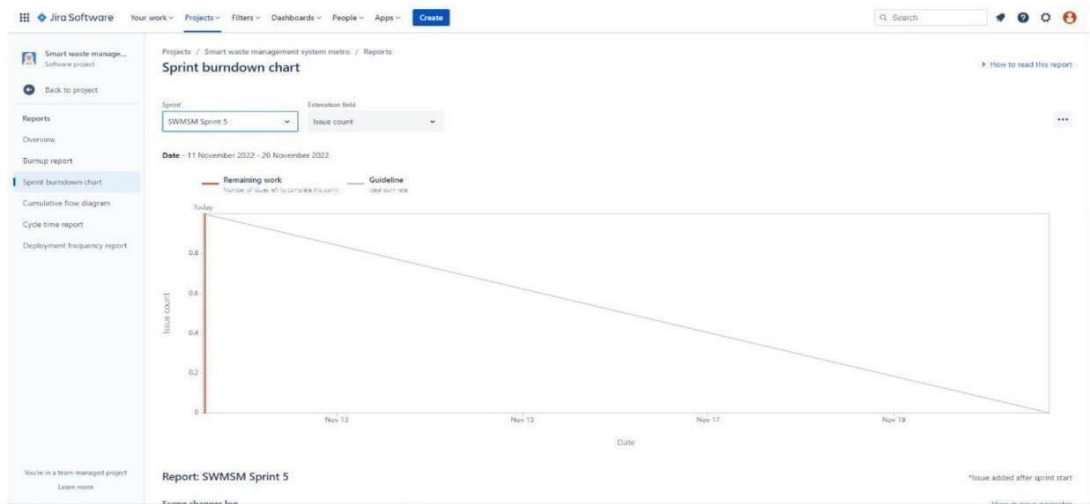

Imagine we have a 10-day sprint duration, and the velocity of the team is 20 (points per sprint). Let's calculate the team's average velocity (AV) per iteration unit (story points per day)

$$AV = \frac{\text{sprint duration}}{\text{velocity}} = \frac{20}{10} = 2$$

Smart Waste Management

Monitoring layout

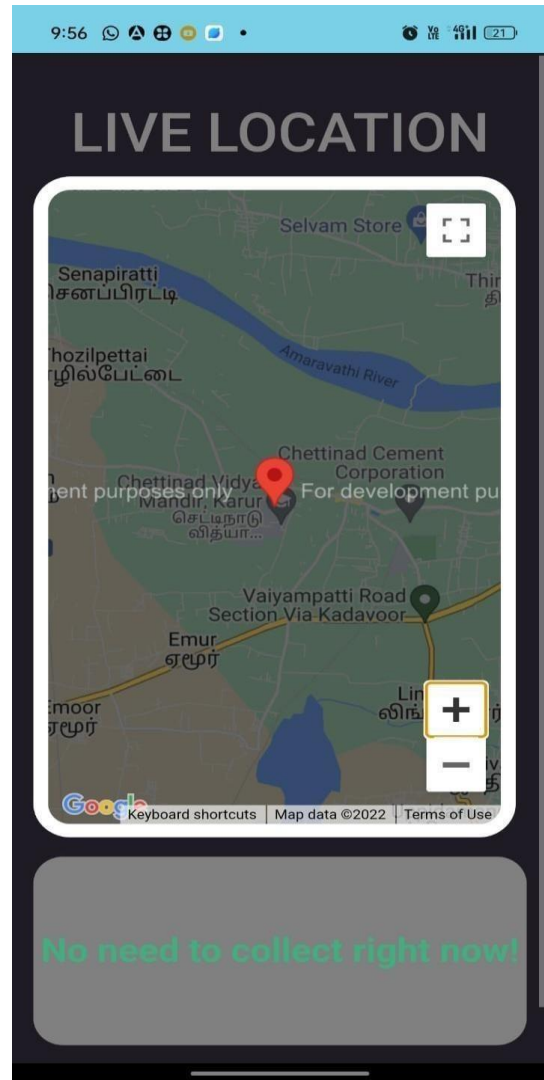

BIN 1

Location Karur

Distance 8

Load cell 15

NEED BIN CHANGE!!!

8.RESULTS & TESTING

8.1 Performance Metrics

9. ADVANTAGES & DISADVANTAGES

ADVANTAGES:

Reduction in Collection Cost
No Missed Pickups
Reduced Overflows
Waste Generation Analysis
CO2 Emission Reduction

DISADVANTAGES:

System requires a greater number of waste bins for separate waste collection as per population in the city.

This results into high initial cost due to expensive smart dustbins compare to other methods.

Sensor nodes used in the dustbins have limited memory size.

10. CONCLUSION

A Smart Waste Management system that is more effective than the one in use now is achievable by using sensors to monitor the filling of bins. Our conception of a "smart waste management system" focuses on waste systems, eliminating human intervention, minimizing human time and effort, and producing a healthy and trash-free environment. The suggested approach can be implemented in smart cities where residents have busy schedules that provide little time for garbage management. If desired, the bins might be put into place in a metropolis where a sizable container would be able to hold enough solid trash for a single unit. The price might be high.

11. FUTURE SCOPE

There are several future works and improvements for the proposed system, including the following:

1. Change the system of user authentication and atomic lock of bins, which would aid in protecting the bin from damage or theft.
2. The concept of green points would encourage the involvement of residents or end users, making the idea successful and aiding in the achievement of collaborative waste management efforts, thus fulfilling the idea of Swachh Bharath.
3. Having case study or data analytics on the type and times waste is collected on different days or seasons, making bin filling predictable and removing the reliance on electronic components, and fixing the coordinates.
4. Improving the Server's and Android's graphical interfaces

```

```
hx = HX711(5, 6)
```

```
# I've found out that, for some reason, the order of the bytes is not always the same between versions of python,
numpy and the hx711 itself.
# Still need to figure out why does it change.
# If you're experiencing super random values, change these values to MSB or LSB until to get more stable values.
# There is some code below to debug and log the order of the bits and the bytes.
# The first parameter is the order in which the bytes are used to build the "long" value.
# The second paramter is the order of the bits inside each byte.
# According to the HX711 Datasheet, the second parameter is MSB so you shouldn't need to modify it.
hx.set_reading_format("MSB", "MSB")
```

PNT2022TMID27367

HOW TO CALCULATE THE REFERENCE UNIT

To set the reference unit to 1. Put 1kg on your sensor or anything you have and know exactly how much it weights.

In this case, 92 is 1 gram because, with 1 as a reference unit I got numbers near 0 without any weight

and I got numbers around 184000 when I added 2kg. So, according to the rule of thirds:

If 2000 grams is 184000 then 1000 grams is $184000 / 2000 = 92$.

hx.set_reference_unit(113)

#hx.set_reference_unit(referenceUnit)

hx.reset()

hx.tare()

print("Tare done! Add weight now...")

to use both channels, you'll need to tare them both

#hx.tare_A()

#hx.tare_B()

def loop():

try:

These three lines are usefull to debug wether to use MSB or LSB in the reading formats

for the first parameter of "hx.set_reading_format("LSB", "MSB")".

Comment the two lines "val = hx.get_weight(5)" and "print val" and uncomment these three lines to see what it prints.

np_arr8_string = hx.get_np_arr8_string()

binary_string = hx.get_binary_string()

print binary_string + " " + np_arr8_string

Prints the weight. Comment if you're debbuging the MSB and LSB issue.

val = hx.get_weight(5)

print(val)

return val

To get weight from both channels (if you have load cells hooked up

to both channel A and B), do something like this

#val_A = hx.get_weight_A(5)

#val_B = hx.get_weight_B(5)

#print "A: %s B: %s" % (val_A, val_B)
